

IN THE SPECIFICATION

[0075] The pH of the composition can advantageously be kept in the range from 0.1 to 4, particularly preferably in the range from 0.5 to 3.5, very particularly preferably in the range from 1 to 3. Any suitable substance can in principle be added to adjust the pH; in particular on the one hand e.g. zinc carbonate and on the other hand e.g. phosphoric acid are suitable. The value of the total acid is preferably in the range from 32 to 45 points, in particular 36 to 40 points, that of the free acid preferably in the range from 5 to 8 points, in particular 6 to 7 points. The ratio of the value of the free total acid to the value of the Fischer total free acid, the so-called S value, is preferably in the range from 0.1 to 0.4, particularly preferably in the range from 0.14 to 0.36, very particularly preferably in the range from 0.18 to 0.32.
